# Reproductive, Maternal & Newborn Health (RMNH) in a Changing Climate

Climate change is reshaping healthcare for reproductive age, pregnant, and newborn patients and worsening inequities in access to safe RMNH care. As a result, there is a growing need for frontline providers to translate climate and health evidence into practical diagnosis, triage, and management tools and facility-level preparedness plans. Through expert lectures, tailored case studies, and action-oriented adaptation resources, this course will equip health professionals to not only recognize climate-related health risks, but to respond safely, equitably, and effectively — even when systems are stressed.

All health professionals are welcome to attend but course materials are designed for **midwives, nurses, physicians, facility managers, birth attendants, and frontline health workers** delivering care in fragile, low-resource, and climate-affected settings.

**Tuesdays**  
**July 7-September 8, 2026**  
**1:00-2:30pm UTC+0**

**Course delivered in English with French and Spanish captioning**

**Course Contact:**
